A PROJECT REPORT
ON

SportSara E-Commerce Platform

By

Abhijeet Dilip Kumar Gupta

Towards The Partial Fulfillment of the
Bachelor of Computer Application

Global Education Trust
Mumbai

TY BCA

2025-2026

Tilak Maharashtra Vidyapeeth, Pune

Department of Computer Science

CERTIFICATE

This is to certify that the project
"**SportSara E-Commerce Platform**"
Has been satisfactorily completed by

Abhijeet Dilip Kumar Gupta

PRN : 04423003340

Towards The Partial Fulfillment of the 'Bachelor of Computer Application',
For the Academic Year 2025-2026 at Global Education Trust Center,
Mumbai,
Tilak Maharashtra Vidyapeeth, Pune (Department of Computer Science), And
it is approved.

Project Guide	**Examiner**	**Head of Department** [GET– Mumbai]

Tilak Maharashtra Vidyapeeth, Pune

Department of Computer Science

ACKNOWLEDGEMENT

With immense pleasure, I am presenting the '**SportSara E-Commerce Platform'** project report as part of the curriculum of '**Bachelor of Computer Application'**. I wish to thank all the people who gave me unending support throughout the development of this project.

I express my profound thanks to our head of department Mr. **Vinit Kakar**, project guide and project incharge **Mr. Haider Zaidi**, and all those who have directly or indirectly guided and helped me in the preparation of this project

I am also thankful to the open-source community and the developers of the MERN stack technologies — MongoDB, Express.js, React.js, and Node.js — whose tools and documentation made this project possible.

Abhijeet Dilip Kumar Gupta

Tilak Maharashtra Vidyapeeth, Pune

Department of Computer Science

ABSTRACT

"**SportSara E-Commerce Platform**" is a full-stack web-based project developed as part of the Bachelor of Computer Applications (BCA) curriculum using **React.js, CSS3, Node.js, Express.js, and MongoDB**. The system is designed as an online store for sports enthusiasts to browse, select, and purchase sports equipment, apparel, footwear, fitness accessories, and team sports gear.

The project solves common problems of traditional sports retail such as limited product reach, manual order processing, absence of customer accounts, lack of product reviews, and no centralized business analytics. SportSara provides an integrated platform for product catalog management, shopping cart, secure checkout with Google Maps address autocomplete, order tracking, and an admin dashboard

The system includes secure user authentication with OTP-based email verification, Google OAuth social login, JWTsession management, and bcrypt password encryption. It also features automated transactional email notifications via the Brevo API, a product reviewand rating system, and role-based access control for admin and customer users. The application is deployed with the frontend hosted on Vercel, backend on Render, and database on MongoDBAtlas cloud, ensuring high availability and scalability..

By combining modern MERN stack technologies with a user-friendly interface, SportSara helps digitize the sports retail experience, reduce manual effort, improve customer engagement, and provide centralized business management. This project demonstrates the practical implementation of full-stack web development for solving real-world e-commerce challenges.

DECLARATION

I hereby declare that the project entitled "SportSara E-Commerce Platform" submitted by me is an original work carried out as part of the Bachelor of Computer Applications (BCA) curriculum

This project has not been submitted in any form to any other university or institution for the award of any degree, diploma, or certificate. To the best of my knowledge, no part of this project has been copied from any other source except where proper acknowledgment has been given.

The project is submitted in partial fulfillment of the requirements for the award of the degree of Bachelor of Computer Applications and is being submitted as the Final Year 6th Semester Project as prescribed in the academic curriculum.

Abhijeet Dilip Kumar Gupta

CHAPTER 1: INTRODUCTION

1.1 Introduction to the System

The sports and fitness industry is experiencing a major shift toward online retail. Consumers increasingly prefer browsing, comparing, and purchasing sports gear and apparel through digital platforms rather than visiting physical stores. Traditional retail methods such as manual billing, paper-based inventory tracking, and walk-in-only shopping create significant limitations in convenience, reach, and efficiency.

SportSara is a full-stack e-commerce web application designed specifically for sports enthusiasts. Built using the MERN stack (MongoDB, Express.js, React.js, Node.js), it provides a seamless online shopping experience for sports equipment, apparel, footwear, fitness accessories, and team sports gear.

The platform enables customers to browse a curated catalog of sports products, filter by categories, view detailed product information including sizes and colors, add items to their cart, and complete purchases through a secure checkout process with address auto-completion powered by Google Maps API. An integrated admin dashboard allows administrators to manage products, orders, and users from a centralized interface.

SportSara incorporates modern security practices including OTP-based email verification during registration, Google OAuth social login, JWT-based session management, and bcrypt password hashing. The system also features automated email notifications via the Brevo transactional email API, product reviews and ratings, and real-time order status tracking.

The application follows a client-server architecture where the React.js frontend communicates with the Express.js backend through RESTful APIs, and the backend interacts with MongoDB Atlas cloud database for persistent data storage. This separation of concerns ensures maintainability, scalability, and ease of deployment.

1.2 Problem Definition

Traditional sports retail businesses face several challenges that limit their growth and customer satisfaction:

- Limited geographical reach — customers must visit physical stores
- No online product catalog or search functionality
- Manual inventory tracking leads to stock discrepancies
- Lack of customer accounts and order history tracking
- No product review or rating system for customer feedback
- Inefficient order processing and status communication
- Inability to offer secure online payments
- Poor customer engagement due to absence of digital tools
- Difficulty managing multiple product categories and variants (sizes, colors)
- No centralized dashboard for business analytics and reporting
- High dependency on manual labor for every transaction
- No automated notifications for order updates or promotions

These limitations reduce sales opportunities, customer satisfaction, and operational efficiency, creating a strong need for an automated e-commerce solution like SportSara.

1.3 Aim

The aim of SportSara is to develop a modern, user-friendly, full-stack e-commerce platform tailored for the sports and fitness industry. It enables customers to browse, select, and purchase sports products online while providing administrators with powerful tools to manage the entire business digitally.

1.4 Objectives

Primary Objectives:

- Provide a responsive online store for sports products across five categories: Team Sports, Apparel, Footwear, Accessories, and Fitness
- Implement secure user authentication with email OTP verification and Google OAuth
- Enable shopping cart functionality with size and color selection
- Build a complete checkout flow with address auto-fill via Google Maps
- Develop an admin dashboard for product, order, and user management
- Integrate product reviews and ratings system

Secondary Objectives:

- Create a visually appealing and mobile-responsive user interface
- Implement automated email notifications for account events
- Ensure data security through encryption and token-based authentication
- Support product search and category filtering
- Enable order tracking with real-time status updates
- Design a scalable architecture for future enhancements
- Deploy the application on cloud platforms for high availability

1.5 Goal

The goal of SportSara is to digitize the sports retail experience through a reliable and scalable web platform, offering:

- Convenient 24/7 shopping access for customers from any device
- Rich product information with images, specifications, sizes, and colors
- Secure account management with multiple authentication options
- Streamlined order processing from cart to delivery tracking
- Data-driven business insights through the admin dashboard
- Enhanced customer engagement through reviews and ratings
- Reduced operational overhead through automation
- Competitive advantage through professional online presence

1.6 Need of the System

SportSara is needed due to the growing demand for online sports shopping and the limitations of traditional retail methods.

Key Needs:

- Digital product catalog with search and filtering capabilities
- Secure online shopping with verified user accounts
- Automated order management replacing manual processes
- Centralized admin panel for efficient business operations
- Customer feedback mechanism through reviews and ratings
- Mobile-responsive design for shopping on any device
- Address validation and auto-completion for accurate deliveries
- Competitive advantage through a professional online presence

1.7 Scope of the Project

The scope of SportSara encompasses the following functional areas:

User Module:

- User registration with email OTP verification
- Google OAuth social login integration
- Email/password login with JWT session management
- Password reset via OTP email
- Profile management (name, avatar, address)

Product Module:

- Product catalog with five categories
- Product details with images, descriptions, sizes, colors, specifications, and benefits
- Product search and category filtering
- Featured products showcase on home page

Shopping Module:

- Shopping cart with variant selection (size + color)
- Cart quantity management
- Checkout with Google Maps address autocomplete
- Cash on Delivery order placement
- Order history and status tracking

Review Module:

- Product reviews and star ratings (1-5)
- One review per user per product constraint
- Average rating calculation

Admin Module:

- Dashboard with analytics (revenue, orders, users, products)
- Product CRUD operations
- Order status management
- User management with role toggle
- Top selling products and low stock alerts
- Monthly revenue chart data

CHAPTER 2: REQUIREMENT SPECIFICATION

2.1 Introduction

Requirement Specification is a critical phase of software development that defines the functional and technical needs of the project. It ensures that the software is developed according to user expectations and business requirements.

For the SportSara E-Commerce Platform, requirement specification identifies the software tools, hardware resources, system environment, and development methodology needed to build a reliable and scalable online store.

2.2 System Environment

Development Environment

Component	Specification
Operating System	Windows 11
Code Editor	Visual Studio Code
Frontend Runtime	Web Browser (Chrome)
Backend Runtime	Node.js v24
Database	MongoDB Atlas (Cloud)
Version Control	Git / GitHub
API Testing	Postman / Browser DevTools

Deployment Environment

Component	Specification
Frontend Hosting	Vercel
Backend Hosting	Render
Database Hosting	MongoDB Atlas
User Access	Internet Browser
Devices Supported	Mobile / Tablet / Laptop / Desktop

Browser Compatibility

- Google Chrome
- Mozilla Firefox
- Microsoft Edge
- Safari

- Opera

User Roles

- **Customer** — Browses products, manages cart, places orders, writes reviews
- **Admin** — Manages products, orders, users, and views analytics dashboard

2.3 Software Requirements

Frontend Technologies

Software	Purpose
HTML5	Page structure and semantic content
CSS3	Styling, animations, and responsive design
JavaScript (ES6+)	Client-side logic and interactivity
React.js	Component-based UI framework
React Router DOM	Client-side routing and navigation
React Hot Toast	Toast notification system
Google Maps Places API	Address autocomplete in checkout

Backend Technologies

Software	Purpose
Node.js	Server-side JavaScript runtime
Express.js v5	Backend web framework and API routing
Mongoose	MongoDB ODM for data modeling
jsonwebtoken	JWT-based authentication
bcryptjs	Password hashing and security
google-auth-library	Google OAuth verification
multer	File upload handling
cors	Cross-origin request handling

dotenv	Environment variable management

2.4 Hardware Requirements

Minimum Requirements

Component	Requirement
Processor	Intel Core i3 or equivalent
RAM	4 GB
Storage	20 GB Free Space
Display	1366 × 768
Internet	Broadband connection

Recommended Requirements

Component	Requirement
Processor	Intel Core i5 / i7 or equivalent
RAM	8 GB or above
Storage	SSD 256 GB+
Display	Full HD (1920 × 1080)
Internet	High-speed broadband

2.5 Methodology

For the SportSara project, **Agile Methodology** was used because it supports continuous development, iterative testing, and incremental improvement.

Why Agile?

- Flexible to requirement changes during development
- Faster feature delivery through sprints
- Easy identification and fixing of bugs

- Continuous feedback integration
- Better quality control through iterative testing

Development Phases

1. **Requirement Gathering** — E-commerce needs analyzed: product catalog, cart, checkout, authentication, admin panel
2. **System Design** — Database schema, UI wireframes, API architecture, and workflow designed
3. **Development** — Modules built: Authentication, Products, Cart, Orders, Admin, Reviews, Payments
4. **Testing** — Functional, UI, API, Security, and Cross-browser testing performed
5. **Deployment** — Frontend deployed on Vercel, Backend on Render, Database on MongoDB Atlas
6. **Maintenance** — Ongoing bug fixes, feature additions, and performance optimization

Agile Cycle: Requirement → Design → Develop → Test → Deploy → Improve

Agile methodology enabled rapid development of SportSara with high-quality output and the flexibility to add features like Google OAuth, address autocomplete, and email verification during the development cycle.

CHAPTER 3: SYSTEM ANALYSIS

3.1 Introduction

System Analysis involves studying the existing system and defining requirements for the new system. It helps identify problems, understand user needs, and design effective solutions. For SportSara, analysis focused on the online sports retail process — product discovery, ordering, payments, and fulfillment.

3.2 Existing System Analysis

Traditional sports retail stores rely on manual processes such as walk-in purchases, handwritten bills, phone-based order inquiries, and physical inventory registers.

Limitations of Existing System

1. No online presence — customers must visit physical stores
2. Manual inventory counting leads to stock errors
3. No product search or filtering capability
4. Limited product information — no specifications, reviews, or variant details
5. Paper-based billing and manual order tracking
6. No customer account or purchase history
7. Poor scalability for growing product catalogs
8. No analytics or business reporting tools
9. Difficulty handling returns and order status updates
10. High dependency on human effort for every transaction

3.3 Proposed System

SportSara automates the entire sports retail experience through a digital platform:

1. Online product catalog with five categories: Team Sports, Apparel, Footwear, Accessories, Fitness

2. Product pages with images, descriptions, sizes, colors, specifications, and benefits
3. Shopping cart with quantity management and variant selection
4. Secure user registration with OTP email verification
5. Google OAuth social login for convenience
6. Checkout with Google Maps address autocomplete
7. Order placement with status tracking (Processing → Confirmed → Shipped → Delivered)
8. Product review and rating system
9. Admin dashboard with product, order, and user management
10. Automated transactional emails via Brevo API

3.4 Feasibility Analysis

- **Technical:** Uses proven MERN stack technologies with large community support
- **Economic:** Low-cost development using open-source tools and free-tier cloud hosting
- **Operational:** Intuitive UI for customers and straightforward admin panel for management
- **Schedule:** Deliverable within the academic project timeline using Agile sprints

3.5 Functional Requirements

Module	Functional Requirement
Authentication	User registration with email OTP verification
Authentication	Google OAuth social login
Authentication	Email/password login with JWT tokens
Authentication	Password reset via OTP email
Products	Browse products by category
Products	View product details with variants
Products	Search products by keyword
Cart	Add/remove items with size and color
Cart	Update item quantity
Orders	Place order with shipping address
Orders	View order history and status
Reviews	Submit product review and rating
Admin	CRUD operations for products
Admin	Manage order statuses
Admin	View dashboard analytics
Admin	Manage user roles

3.6 Non-Functional Requirements

Requirement	Description
Performance	API response times under 500ms, page load under 2 seconds
Security	Password encryption, JWT authentication, role-based access

Responsiveness	Mobile-first design across all screen sizes
Reliability	99.9% uptime via cloud hosting
Scalability	Horizontal scaling with MongoDB Atlas and cloud deployment
Maintainability	Modular code with separation of concerns
Usability	Intuitive navigation and clear error messages

3.7 Use Case Analysis

Use Case 1: User Registration

Actor: New Customer

Precondition: User is not registered

Steps: 1) User enters name, email, password 2) System sends 6-digit OTP to email via Brevo API 3) User enters OTP 4) System verifies OTP (5-minute expiry) 5) Account created with hashed password 6) JWT token issued

Postcondition: User is logged in with new account

Use Case 2: Product Purchase

Actor: Registered Customer

Precondition: User is logged in

Steps: 1) User browses products 2) Selects size and color 3) Adds to cart 4) Proceeds to checkout 5) Enters shipping address with Google Maps autocomplete 6) Selects payment method 7) Confirms order

Postcondition: Order created, stock updated, cart cleared

Use Case 3: Admin Order Management

Actor: Admin

Precondition: Admin is logged in

Steps: 1) Admin views all orders 2) Selects an order 3) Updates status (Processing → Confirmed → Shipped → Delivered) 4) System saves status

Postcondition: Order status updated

3.8 Gantt Chart

A Gantt Chart represents tasks and schedules over a timeline for project planning.

Task	W1	W2	W3	W4	W5	W6	W7	W8
Requirement Gathering	✓	✓						
System Analysis		✓	✓					
UI Design			✓	✓				
Database Design			✓	✓				
Frontend Development				✓	✓	✓		
Backend Development				✓	✓	✓		
API Integration					✓	✓		
Testing						✓	✓	
Deployment							✓	✓
Documentation	✓	✓	✓	✓			✓	✓

3.9 Conclusion

System analysis identified the inefficiencies of manual sports retail systems and confirmed the need for a digital solution. SportSara provides a complete e-commerce platform for managing product sales efficiently. Feasibility analysis confirmed the project is practical and cost-effective. The use case analysis defined clear user interactions for all major system functions. The Gantt chart ensured proper planning and timely execution of all development phases.

CHAPTER 4: SURVEY OF TECHNOLOGY

4.1 Introduction

Technology selection is crucial for the performance, security, scalability, and maintainability of any software project. For SportSara, the MERN stack was chosen — a widely adopted JavaScript-based technology stack that enables full-stack development using a single programming language across both frontend and backend.

4.2 Technology Stack Overview

Layer	Technology	Version
Frontend Framework	React.js	18.x
Styling	CSS3	—
Backend Runtime	Node.js	v24
Backend Framework	Express.js	v5.2
Database	MongoDB (Mongoose)	v8.x
Authentication	JWT + Google OAuth 2.0	—
Email Service	Brevo REST API	v3
File Uploads	Multer	—
Maps	Google Maps Places API	New
Frontend Hosting	Vercel	—
Backend Hosting	Render	—

4.3 Frontend Technologies

4.3.1 React.js

React.js is a JavaScript library developed by Facebook for building dynamic, component-based user interfaces. It uses a virtual DOM (Document Object Model) to

efficiently update only the changed parts of the page, resulting in fast rendering and a smooth user experience.

Key Features Used in SportSara:

- **Components:** Reusable UI blocks — Header, Footer, Product Card, Payment Modal, Admin Layout
- **Hooks:** useState for local state, useEffect for side effects, useContext for global state, useNavigate for routing
- **Context API:** AuthContext manages user session globally, CartContext manages shopping cart state
- **React Router DOM:** Handles client-side routing with public routes, protected routes, and admin routes
- **Conditional Rendering:** Shows different UI based on login status and user role (admin/user)

4.3.2 CSS3

Custom CSS3 provides complete control over the application's visual design without dependency on external UI frameworks.

Features Used: Flexbox and Grid layouts, CSS animations and transitions, responsive media queries, custom scrollbars, form styling, glassmorphism effects, dark-themed admin panel.

4.3.3 Google Maps Places API

The Google Maps Places API (New) is integrated into the checkout page to provide real-time address autocomplete suggestions. As users type their address, the API returns matching locations. When a suggestion is selected, the system auto-fills city, state, and pincode fields.

4.4 Backend Technologies

4.4.1 Node.js

Node.js is a server-side JavaScript runtime built on Chrome's V8 engine. It enables non-blocking, event-driven I/O operations, making it ideal for handling concurrent API requests in an e-commerce application.

Why Node.js for SportSara:

- Single language (JavaScript) across frontend and backend reduces context switching
- Event-driven architecture handles multiple simultaneous API requests efficiently
- NPM ecosystem provides ready-made packages for authentication, database, email, etc.
- Fast execution speed for I/O-heavy operations like database queries and API calls
- Easy horizontal scaling and deployment on cloud platforms

4.4.2 Express.js v5

Express.js is a minimal and flexible web framework for Node.js that provides robust HTTP routing, middleware support, and error handling.

Middleware Used in SportSara:

- **cors:** Allows cross-origin requests from the React frontend to the Express backend
- **express.json():** Parses incoming JSON request bodies
- **auth middleware:** Verifies JWT tokens on protected routes
- **adminAuth middleware:** Verifies admin role for admin-only routes
- **multer:** Handles multipart/form-data for product image uploads
- **express.static:** Serves uploaded product images from the /uploads directory

Routes Configured: 8 route modules — auth, products, cart, orders, payment, reviews, admin, upload

4.5 Database Technology

4.5.1 MongoDB

MongoDB is a NoSQL document database that stores data in flexible JSON-like BSON documents. Unlike relational databases, MongoDB does not require a fixed schema, allowing easy modification of data structures.

Advantages for SportSara:

- Flexible schema — product specifications and variants can vary between items
- Embedded documents — cart items are embedded within the user document for fast access
- Horizontal scaling through sharding
- Rich query language with aggregation pipelines
- MongoDB Atlas provides managed cloud hosting with automated backups

4.5.2 Mongoose ODM

Mongoose provides schema-based data modeling for MongoDB, adding validation, type casting, query building, and middleware hooks. SportSara uses 6 Mongoose models: User, Product, Order, Review, OTP, and PasswordResetOTP.

Key Mongoose Features Used:

- Schema validation with required fields and enums
- Pre-save hooks for password hashing
- Instance methods for password comparison
- Population for joining referenced documents
- Compound indexes for performance optimization
- Text indexes for full-text product search

4.6 Authentication Technologies

4.6.1 JWT (JSON Web Token)

JWT provides stateless, token-based authentication for secure API access. When a user logs in, the server generates a signed JWT containing the user ID, which is sent back to the client. The client includes this token in the Authorization header of every subsequent API request.

JWT Configuration in SportSara:

- Token payload: { id: user._id }
- Signing algorithm: HS256 (HMAC with SHA-256)
- Token expiry: 30 days
- Secret key: Stored in environment variable JWT_SECRET
- Verification: auth middleware decodes and validates token on every protected route

4.6.2 Google OAuth 2.0

Google OAuth allows users to authenticate using their Google account. SportSara uses the google-auth-library package to verify Google ID tokens on the backend.

Flow: 1) User clicks "Sign in with Google" 2) Google returns ID token 3) Backend verifies token with google-auth-library 4) If email exists, login; if not, create account 5) JWT token issued

4.6.3 OTP Email Verification

A 6-digit random OTP is generated during registration and password reset. The OTP is stored in MongoDB with a 5-minute TTL (Time To Live) expiry using createdAt index. The OTP is sent to the user's email via the Brevo transactional email API.

4.6.4 bcryptjs Password Hashing

All passwords are hashed using bcrypt with 10 salt rounds before storage. The pre-save hook automatically hashes passwords when modified. A comparePassword

instance method verifies login credentials.

4.7 API and Integration Technologies

4.7.1 RESTful API

RESTful APIs connect the React frontend with the Express.js backend using JSON data format over HTTP.

Method	Use	Example
GET	Read/Fetch data	GET /api/products
POST	Create new records	POST /api/auth/login
PUT	Update existing records	PUT /api/admin/orders/:id
DELETE	Remove records	DELETE /api/cart/remove/:id

4.7.2 Brevo Transactional Email API

SportSara uses the Brevo (formerly Sendinblue) REST API for sending OTP verification emails and password reset emails. Emails are sent via HTTPS POST requests to api.brevo.com/v3/smtp/email with the API key stored in environment variables.

4.8 Deployment Technologies

- **Vercel** — Frontend hosting with automatic CI/CD from GitHub, edge network for fast delivery
- **Render** — Backend hosting with Node.js support, environment variables, and auto-deploy
- **MongoDB Atlas** — Cloud database with M0 free tier, automated backups, global clusters

4.9 Technology Comparison

4.9.1 Why MERN over MEAN Stack

Feature	MERN (React)	MEAN (Angular)
Learning Curve	Easier — library-based	Steeper — full framework

Performance	Virtual DOM — faster rendering	Real DOM — slower updates
Flexibility	Choose own tools	Opinionated structure
Bundle Size	Smaller — tree-shakeable	Larger default bundle
Community	Larger npm ecosystem	Enterprise-focused
Mobile	React Native available	Ionic/NativeScript

React.js was chosen for SportSara because of its simpler learning curve, faster rendering via virtual DOM, larger community support, and the ability to extend to mobile apps via React Native in the future.

4.9.2 Why MongoDB over MySQL

Feature	MongoDB (NoSQL)	MySQL (SQL)
Schema	Flexible — no fixed schema	Rigid — predefined tables
Data Format	JSON-like BSON documents	Rows and columns
Scaling	Horizontal (sharding)	Vertical (bigger server)
Relationships	Embedding + referencing	Foreign keys + JOINs
Product Variants	Easy — nested arrays	Complex — multiple tables
Cloud Hosting	Atlas free tier	Paid services mostly

MongoDB was ideal for SportSara because product data varies significantly — some products have sizes, some have colors, some have both. MongoDB's flexible schema handles this naturally without requiring multiple join tables. The embedded cart pattern within the user document also eliminates the need for a separate cart table, improving read performance.

4.9.3 Why Express.js v5 over Fastify

Feature	Express.js v5	Fastify
Maturity	Most popular Node.js framework	Newer, less adoption
Middleware	Vast ecosystem	Limited plugin system
Documentation	Extensive	Growing
Async Support	v5 has native async error handling	Built-in
Community	Largest in Node.js	Smaller

Express.js v5 was chosen because of its industry dominance, extensive middleware ecosystem, and the new async error handling feature that eliminates the need for try-catch wrappers in route handlers.

4.9.4 Why Vercel + Render over AWS

Feature	Vercel + Render	AWS (EC2 + S3)
Setup Time	Minutes (GitHub connect)	Hours (manual config)
Cost	Free tier available	Pay-as-you-go
CI/CD	Automatic on push	Manual pipeline setup
Complexity	Simple dashboard	Complex console
SSL	Auto HTTPS	Manual certificate
Scaling	Auto-managed	Manual configuration

Vercel and Render were chosen for their simplicity, zero-configuration deployment, and generous free tiers — perfect for an academic project that needs professional-grade hosting without cost.

4.10 Working Principles

4.10.1 How React Virtual DOM Works

When state changes in a React component, React creates a new virtual DOM tree. It then compares the new tree with the previous one using a "diffing" algorithm. Only the nodes that actually changed are updated in the real DOM. This process, called "reconciliation," makes React significantly faster than traditional DOM manipulation.

In SportSara, when a user adds a product to the cart, only the cart icon count and cart sidebar update — the entire page does not re-render. This provides a smooth, app-like experience.

4.10.2 How JWT Authentication Works

JWT (JSON Web Token) is a compact, URL-safe token format used for stateless authentication:

1. **Header** — Contains algorithm (HS256) and token type (JWT)
2. **Payload** — Contains user ID and issued/expiry timestamps
3. **Signature** — HMAC-SHA256 hash of header + payload using a secret key

The three parts are Base64-encoded and joined with dots: xxxxx.yyyyy.zzzzz. The server verifies the token by recalculating the signature with its secret key. If the signatures match, the token is valid and the user ID is extracted from the payload.

4.10.3 How MongoDB Indexing Improves Performance

SportSara uses multiple indexes to speed up frequent queries:

- **Category + Featured + CreatedAt** — Speeds up home page featured product queries
- **Price index** — Enables fast price-range filtering on the shop page
- **Rating index** — Sorts products by rating efficiently
- **Text index (name, description, brand)** — Powers full-text product search

Without indexes, MongoDB would perform a "collection scan" checking every document. With indexes, queries use B-tree structures to find matching documents in O(log n) time instead of O(n), resulting in sub-100ms query times even with thousands of products.

4.10.4 How Google OAuth 2.0 Works in SportSara

1. User clicks "Sign in with Google" button on the frontend
2. Google's OAuth popup appears and user selects their Google account

3. Google returns an ID token (a signed JWT from Google) to the frontend
4. Frontend sends this ID token to the SportSara backend: POST /api/auth/google
5. Backend uses google-auth-library to verify the token's signature with Google's public keys
6. Backend extracts email and name from the verified token payload
7. If email exists in database → login; if not → create new account
8. Backend generates its own JWT and returns it to the frontend
9. Frontend stores JWT in localStorage for subsequent API requests

4.11 Conclusion

The MERN stack technologies selected for SportSara are modern, well-supported, and industry-standard. Technology comparisons confirm that React.js, Node.js, MongoDB, and Express.js are optimal choices for this project. The cloud deployment strategy using Vercel, Render, and MongoDB Atlas ensures high availability, easy maintenance, and zero-cost hosting for an academic project.

CHAPTER 5: SYSTEM DESIGN

5.1 Introduction

System Design is the phase where project requirements are converted into a technical blueprint. It defines the software modules, database structure, API endpoints, security model, and communication flow between components. For SportSara, the design focuses on a modular client-server architecture with clear separation between the React frontend, Express.js backend, and MongoDB database.

5.2 System Architecture

SportSara follows a **Three-Tier Architecture**:

Presentation Layer (Frontend)

- React.js for component-based UI with virtual DOM
- CSS3 for styling and responsive design
- React Router DOM for client-side navigation (BrowserRouter)
- Context API for global state management (AuthContext, CartContext)
- Google Maps Places API for address autocomplete

Application Layer (Backend)

- Node.js runtime environment with ES modules
- Express.js v5 web framework with 8 route modules
- JWT middleware for user authentication
- AdminAuth middleware for role-based access control
- Multer middleware for file upload processing
- CORS middleware for cross-origin requests

Data Layer (Database)

- MongoDB Atlas cloud database (M0 Free Tier)
- Mongoose ODM for schema enforcement and validation

- 6 collections: Users, Products, Orders, Reviews, OTPs, PasswordResetOTPs
- Performance indexes on frequently queried fields

Data Flow: React UI → HTTP/REST → Express API → Mongoose ODM → MongoDB Atlas

5.3 Data Flow Diagram

Level 0 — Context Diagram

Customer → SportSara Web App → Express API Server → MongoDB Atlas

Admin → Admin Dashboard → AdminAuth Middleware → Express API → MongoDB Atlas

Level 1 — Main Processes

1. **Authentication Process:** User submits credentials → Server validates → JWT token issued → Token stored in localStorage → Sent with every API request
2. **Product Browsing:** User requests products → Server queries MongoDB with category/search filters → Products returned as JSON → React renders product cards
3. **Cart Management:** User adds item with size+color → Cart updated in user document (embedded) → Cart state synced with backend on every change
4. **Order Processing:** User submits order → Server validates cart items and address → Order document created with item snapshot → Product stock decremented → Cart cleared
5. **Review System:** User submits review → Server checks unique constraint (one per user per product) → Review stored with user reference → Average rating calculated
6. **Admin Management:** Admin accesses dashboard → AdminAuth middleware validates role → Dashboard stats aggregated from Orders, Products, Users collections

5.4 Database Schema

Users Collection

Field	Type	Description
name	String (required)	User's full name
email	String (unique, required)	Login email address
password	String (hashed)	Bcrypt-encrypted password (10 salt rounds)
role	String (enum: user, admin)	User role for access control
avatar	String	Profile picture URL
cart	Array (embedded)	Cart items: {product: ObjectId, quantity, color, size}
address	Object (embedded)	Saved address: {street, city, state, pincode, phone}
createdAt	Date (auto)	Account creation timestamp

Products Collection

Field	Type	Description
name	String	Product title
image	String	Product image URL
brand	String	Brand name
category	String (enum)	Team Sports / Apparel / Footwear / Accessories / Fitness
description	String	Product description
price	Number	Selling price (INR)
mrp	Number	Maximum retail price
rating	Number (0-5)	Average star rating
stock	Number	Available quantity

featured	Boolean	Featured product flag for homepage
sizes	Array of Strings	Available sizes (S, M, L, XL, etc.)
colors	Array of Objects	{name, hex, stock} for each color variant
specifications	Array of Objects	{key, value} pairs for product specs
benefits	Array of Strings	Product benefits list
gender	String	Target gender (Men, Women, Unisex)

Orders Collection

Field	Type	Description
user	ObjectId (ref: User)	Reference to the buyer
items	Array of Objects	{product, name, price, quantity, image, color, size}
totalAmount	Number	Total order value in INR
shippingAddress	Object	{fullName, street, city, state, pincode, phone}
paymentMethod	String	Cash on Delivery / Online
status	String (enum)	Processing / Confirmed / Shipped / Delivered / Cancelled
createdAt	Date (auto)	Order placement timestamp

Reviews Collection

Field	Type	Description
user	ObjectId (ref: User)	Reviewer reference
product	ObjectId (ref: Product)	Reviewed product reference
rating	Number (1-5)	Star rating
title	String	Review headline
comment	String	Review body text
createdAt	Date (auto)	Review timestamp

Unique Constraint: Compound unique index on {user, product} ensures one review per user per product.

OTP Collections

Collection	Fields	Purpose

otps	email, otp, name, password, createdAt (TTL: 5min)	Registration OTP verification with pending user data
passwordresetotps	email, otp, createdAt (TTL: 5min)	Password reset OTP verification

5.5 REST API Design

Authentication APIs (8 endpoints)

Method	Endpoint	Auth	Purpose
POST	/api/auth/send-otp	No	Send registration OTP
POST	/api/auth/verify-otp	No	Verify OTP and create account
POST	/api/auth/login	No	Email/password login
POST	/api/auth/google	No	Google OAuth login
GET	/api/auth/me	JWT	Get current user profile
PUT	/api/auth/profile	JWT	Update profile
POST	/api/auth/forgot-password	No	Send password reset OTP
POST	/api/auth/reset-password	No	Reset password with OTP

Product APIs (3 endpoints)

Method	Endpoint	Auth	Purpose
GET	/api/products	No	List products with filters
GET	/api/products/:id	No	Get product details
GET	/api/products/:id/reviews	No	Get product reviews

Cart APIs (4 endpoints)

Method	Endpoint	Auth	Purpose
GET	/api/cart	JWT	Get user cart
POST	/api/cart/add	JWT	Add item to cart
PUT	/api/cart/update	JWT	Update item quantity
DELETE	/api/cart/remove/:id	JWT	Remove cart item

Order APIs (3 endpoints)

Method	Endpoint	Auth	Purpose
POST	/api/orders	JWT	Place new order (COD)
GET	/api/orders	JWT	Get user orders
GET	/api/orders/:id	JWT	Get single order details

Admin APIs (7 endpoints)

Method	Endpoint	Auth	Purpose
GET	/api/admin/stats	Admin	Dashboard analytics
GET	/api/admin/products	Admin	List all products
POST	/api/admin/products	Admin	Add new product

PUT	/api/admin/products/:id	Admin	Update product
DELETE	/api/admin/products/:id	Admin	Delete product
GET	/api/admin/orders	Admin	List all orders
PUT	/api/admin/orders/:id	Admin	Update order status

5.6 E-R Diagram

Entity relationships in SportSara:

- **User (1) → (M) Orders** — One user places many orders
- **User (1) → (M) Reviews** — One user writes many reviews
- **User (1) → (M) Cart Items** — Embedded subdocuments
- **Product (1) → (M) Reviews** — One product has many reviews
- **Product (1) → (M) Order Items** — One product in many orders
- **User-Product Review:** Unique compound index

5.7 Sequence Diagrams

User Registration Sequence

User → Frontend: Enter name, email, password → Frontend → Backend: POST /api/auth/send-otp → Backend: Generate 6-digit OTP → Backend → Brevo API: Send OTP email → Backend → MongoDB: Store OTP with 5-min TTL → User → Frontend: Enter OTP → Frontend → Backend: POST /api/auth/verify-otp → Backend: Verify OTP, hash password → Backend → MongoDB: Create User → Backend → Frontend: Return JWT token → Frontend: Store token, redirect to home

Order Placement Sequence

User → Frontend: Click "Place Order" → Frontend → Backend: POST /api/orders (with JWT) → Backend: auth middleware validates token → Backend → MongoDB: Populate user cart items → Backend: Create order document with item snapshots → Backend: Calculate totalAmount → Backend → MongoDB: Decrement product stock for each item → Backend → MongoDB: Clear user cart → Backend → Frontend: Return order object → Frontend: Show order confirmation

5.8 Conclusion

The system design provides a modular three-tier architecture with clear separation of concerns. The MongoDB schema uses document embedding for cart data and referencing for orders and reviews. The REST API design with 25+ endpoints enables seamless frontend-backend communication.

CHAPTER 6: SYSTEM IMPLEMENTATION

6.1 Introduction

System Implementation converts the design into a working application. SportSara followed a modular development approach with backend APIs built first, followed by frontend screens, then integration testing and deployment.

Implementation Sequence

1. MongoDB Database Schema Design with Mongoose
2. Authentication System (JWT, OTP, Google OAuth)
3. Product Management REST APIs
4. Cart and Order Processing APIs
5. Review and Rating System
6. Admin Dashboard and Management APIs
7. Frontend UI Screens (React.js)
8. Google Maps Address Integration
9. Email Notification Service (Brevo API)
10. Testing and Deployment

6.2 Project Structure

Backend Structure

```
backend/
├── config/

└── App.js                  # Routes & providers
```

6.3 Server Configuration (server.js)

The main server file initializes Express, connects to MongoDB, configures middleware, and mounts all 8 route modules.

```
import dns from 'dns';
dns.setDefaultResultOrder('ipv4first');

import express from 'express';
import dotenv from 'dotenv';
import cors from 'cors';
import connectDB from './config/db.js';
import path from 'path';

// Route imports
import authRoutes from './routes/authRoutes.js';
import productRoutes from './routes/productRoutes.js';
import cartRoutes from './routes/cartRoutes.js';
import orderRoutes from './routes/orderRoutes.js';
import paymentRoutes from './routes/paymentRoutes.js';
import reviewRoutes from './routes/reviewRoutes.js';
import adminRoutes from './routes/adminRoutes.js';
import uploadRoutes from './routes/uploadRoutes.js';

dotenv.config();
connectDB();

const app = express();
app.use(cors());
app.use(express.json());

// Health check
app.get('/api/health', (req, res) => res.json({ status: 'ok' }));

// Mount routes
app.use('/api/auth', authRoutes);
app.use('/api/products', productRoutes);
app.use('/api/cart', cartRoutes);
app.use('/api/orders', orderRoutes);
app.use('/api/payment', paymentRoutes);
app.use('/api/reviews', reviewRoutes);
app.use('/api/admin', adminRoutes);
app.use('/api/upload', uploadRoutes);

const __dirname = path.resolve();
app.use('/uploads', express.static(path.join(__dirname,
'/uploads')));

const PORT = process.env.PORT || 8000;
app.listen(PORT, () => {
```

```
  console.log('SportSara server running on port ' + PORT);
});
```

6.4 Database Connection (db.js)

```
import mongoose from 'mongoose';

const connectDB = async () => {
  try {
    const conn = await mongoose.connect(process.env.MONGO_URI, {
      family: 4, // Forces IPv4 to avoid DNS resolution issues
    });
    console.log('MongoDB Connected: ' + conn.connection.host);
  } catch (error) {
    console.error('Error connecting to MongoDB: ' + error.message);
    process.exit(1);
  }
};

export default connectDB;
```

6.5 Authentication Module

6.5.1 JWT Middleware (auth.js)

```
const auth = async (req, res, next) => {
  const token = req.header('Authorization')?.replace('Bearer ', '');
  if (!token) return res.status(401).json({ message: 'No token' });
  try {
    const decoded = jwt.verify(token, process.env.JWT_SECRET);
    req.user = await User.findById(decoded.id).select('-password');
    if (!req.user) return res.status(401).json({ message: 'User not
found' });
    next();
  } catch (error) {
    res.status(401).json({ message: 'Token invalid' });
  }
};

const adminAuth = async (req, res, next) => {
  await auth(req, res, () => {
    if (req.user && req.user.role === 'admin') next();
    else res.status(403).json({ message: 'Admin access required' });
  });
};
```

6.5.2 Password Security (userModel.js)

```
userSchema.pre('save', async function () {
  if (!this.isModified('password')) return;
  const salt = await bcrypt.genSalt(10);
  this.password = await bcrypt.hash(this.password, salt);
});

userSchema.methods.comparePassword = async function
(candidatePassword) {
  return await bcrypt.compare(candidatePassword, this.password);
};
```

6.5.3 Product Schema with Performance Indexes

```
productSchema.index({ category: 1, featured: 1, createdAt: -1 });
productSchema.index({ featured: 1, createdAt: -1 });
productSchema.index({ price: 1 });
productSchema.index({ rating: -1 });
productSchema.index({ name: 'text', description: 'text', brand:
'text' });
```

6.6 Product Management Module

Admin can perform full CRUD operations on products. Products support multiple sizes, colors with individual stock, specifications, and benefits.

```
// POST /api/admin/products — Add new product
router.post('/products', adminAuth, async (req, res) => {
  try {
    const product = await new Product({
      ...req.body, user: req.user._id
    }).save();
    res.status(201).json(product);
  } catch (e) {
    res.status(500).json({ message: 'Server error', error: e.message
});
  }
});

// PUT /api/admin/products/:id — Update product
router.put('/products/:id', adminAuth, async (req, res) => {
  try {
    const product = await Product.findByIdAndUpdate(
      req.params.id, req.body, { new: true }
    );
    if (!product) return res.status(404).json({ message: 'Not found'
});
    res.json(product);
  } catch (e) {
    res.status(500).json({ message: 'Server error' });
  }
});
```

6.7 Cart Management Module

Cart items are embedded within the User document. Items are differentiated by productId + color + size combination, allowing the same product with different variants to exist as separate cart entries.

```
// POST /api/cart/add — Add item to cart
router.post('/add', auth, async (req, res) => {
  try {
    const { productId, quantity = 1, color, size } = req.body;
    const user = await User.findById(req.user._id);

    // Differentiate items by productId + color + size
    const existingItem = user.cart.find(
      (item) => item.product.toString() === productId
        && item.color === color && item.size === size
    );

    if (existingItem) {
      existingItem.quantity += quantity;
    } else {
      user.cart.push({ product: productId, quantity, color, size });
    }

    await user.save();
    await user.populate('cart.product');
    const validCart = user.cart.filter((item) => item.product);
    res.json(validCart);
  } catch (error) {
    res.status(500).json({ message: 'Server error' });
  }
});

// PUT /api/cart/update — Update item quantity
router.put('/update', auth, async (req, res) => {
  const { productId, quantity, color, size } = req.body;
  const user = await User.findById(req.user._id);
  const item = user.cart.find(
    (item) => item.product.toString() === productId
      && item.color === color && item.size === size
  );
  if (quantity <= 0) {
    user.cart = user.cart.filter(
      (item) => !(item.product.toString() === productId
        && item.color === color && item.size === size)
    );
  } else {
    item.quantity = quantity;
  }
  await user.save();
```

```
  await user.populate('cart.product');
  res.json(user.cart.filter((item) => item.product));
});
```

6.8 Order Processing Module

Orders are placed via COD (Cash on Delivery). The system creates an order snapshot, decrements stock, and clears the cart.

```
// POST /api/orders — Place order
router.post('/', auth, async (req, res) => {
  const { shippingAddress } = req.body;
  const user = await
User.findById(req.user._id).populate('cart.product');
  const validCart = user.cart.filter((item) => item.product);

  // Create order items snapshot
  const items = validCart.map((item) => ({
    product: item.product._id,
    name: item.product.name,
    price: item.product.price,
    quantity: item.quantity,
    image: item.product.image,
    color: item.color,
    size: item.size,
  }));

  const totalAmount = items.reduce(
    (sum, item) => sum + item.price * item.quantity, 0
  );

  const order = await Order.create({
    user: req.user._id, items, totalAmount,
    shippingAddress, paymentMethod: 'Cash on Delivery',
    status: 'Processing',
  });

  // Update stock for each item
  for (const item of validCart) {
    await Product.findByIdAndUpdate(item.product._id, {
      $inc: { stock: -item.quantity },
    });
  }

  user.cart = []; // Clear cart
  await user.save();
  res.status(201).json(order);
});
```

6.9 Review System Module

Users can submit one review per product. The system calculates average ratings and enforces uniqueness through a compound index.

```
// GET /api/reviews/:productId — Get all reviews
router.get('/:productId', async (req, res) => {
  const reviews = await Review.find({ product: req.params.productId
})
    .populate('user', 'name')
    .sort({ createdAt: -1 })
    .lean();

  const count = reviews.length;
  const avgRating = count > 0
    ? reviews.reduce((sum, r) => sum + r.rating, 0) / count : 0;

  res.json({
    reviews,
    avgRating: Math.round(avgRating * 10) / 10,
    count
  });
});

// POST /api/reviews/:productId — Submit review
router.post('/:productId', auth, async (req, res) => {
  try {
    const { rating, title, comment } = req.body;
    const review = await Review.create({
      user: req.user._id,
      product: req.params.productId,
      rating, title, comment,
    });
    const populated = await review.populate('user', 'name');
    res.status(201).json(populated);
  } catch (error) {
    if (error.code === 11000) {
      return res.status(400).json({
        message: 'You have already reviewed this product'
      });
    }
    res.status(500).json({ message: 'Server error' });
  }
});
```

6.10 Admin Dashboard Module

The admin dashboard aggregates analytics data from all collections including total revenue, order counts by status, top selling products, low stock alerts, and monthly revenue trends.

```
// GET /api/admin/stats — Dashboard analytics
router.get('/stats', adminAuth, async (req, res) => {
  const [totalProducts, totalUsers, totalOrders, orders] =
    await Promise.all([
      Product.countDocuments(),
      User.countDocuments(),
      Order.countDocuments(),
      Order.find().lean(),
    ]);

  const totalRevenue = orders.reduce(
    (sum, o) => sum + o.totalAmount, 0
  );
  const confirmedOrders = orders.filter(
    (o) => o.status === 'Confirmed'
  ).length;
  const deliveredOrders = orders.filter(
    (o) => o.status === 'Delivered'
  ).length;

  // Top selling products
  const productSales = {};
  orders.forEach((o) => {
    o.items.forEach((item) => {
      const id = item.product.toString();
      productSales[id] = (productSales[id] || 0) + item.quantity;
    });
  });

  // Low stock alerts
  const lowStock = await Product.find({ stock: { $lt: 15 } }).lean();

  res.json({
    totalProducts, totalUsers, totalOrders, totalRevenue,
    confirmedOrders, deliveredOrders, lowStock,
    // ... monthly revenue, recent orders, top selling
  });
});
```

6.11 Email Service Module

Transactional emails are sent via the Brevo (Sendinblue) REST API using native HTTPS requests.

```
export const sendEmail = async (to, subject, htmlContent) => {
  const payload = JSON.stringify({
    sender: { name: 'SportSara', email: fromEmail },
    to: [{ email: to }],
    subject,
    htmlContent,
  });

  const options = {
    hostname: 'api.brevo.com',
    path: '/v3/smtp/email',
    method: 'POST',
    headers: {
      'Content-Type': 'application/json',
      'api-key': process.env.EMAIL_PASS,
      'Content-Length': Buffer.byteLength(payload),
    },
  };

  return new Promise((resolve, reject) => {
    const req = https.request(options, (res) => {
      let data = '';
      res.on('data', (chunk) => data += chunk);
      res.on('end', () => resolve(JSON.parse(data)));
    });
    req.on('error', reject);
    req.write(payload);
    req.end();
  });
};
```

Frontend Route Protection

```
// Admin Route Protection (App.js)
function AdminRoute({ children }) {
  const { user, loading } = useAuth();
  if (loading) return null;
  if (!user || user.role !== 'admin') return ;
  return children;
}

// Protected Route
function PrivateRoute({ children }) {
```

```
  const { user, loading } = useAuth();
  if (loading) return null;
  if (!user) return ;
  return children;
}
```

6.12 Testing Approach

- **Unit Testing** — Password hashing, token generation, OTP validation, cart calculations
- **Integration Testing** — API endpoint testing with database operations via Postman
- **UI Testing** — Responsive design verification across desktop, tablet, and mobile
- **Security Testing** — Authentication bypass attempts, expired token handling, SQL injection
- **Cross-Browser Testing** — Chrome, Firefox, Edge, Safari compatibility
- **Performance Testing** — API response times, page load optimization

6.13 Test Cases

ID	Test Scenario	Expected Result	Status
T01	Register with valid OTP	Account created, JWT returned	Pass
T02	Register with expired OTP	Error: OTP expired	Pass
T03	Register with invalid OTP	Error: Invalid OTP	Pass
T04	Login with correct credentials	JWT token returned	Pass
T05	Login with wrong password	401 Unauthorized	Pass
T06	Google OAuth login (new user)	Account created + JWT	Pass
T07	Google OAuth login (existing)	Login + JWT returned	Pass
T08	Access protected route without token	401 No token	Pass
T09	Access protected route with expired token	401 Token invalid	Pass
T10	Access admin route as regular user	403 Admin access required	Pass
T11	Add product to cart	Cart updated with item	Pass
T12	Add same product different size	Separate cart entry created	Pass
T13	Update cart quantity to 0	Item removed from cart	Pass
T14	Place order with valid address	Order created, stock updated	Pass
T15	Place order with empty cart	Error: Cart is empty	Pass
T16	Submit product review	Review saved	Pass
T17	Submit duplicate review	Error: Already reviewed	Pass
T18	Admin update order status	Status changed	Pass
T19	Admin add new product	Product created	Pass

T20	Admin delete product	Product removed	Pass
T21	Password reset with valid OTP	Password updated	Pass
T22	Product search by keyword	Matching products returned	Pass
T23	Filter products by category	Category products shown	Pass
T24	View order as non-owner	403 Not authorized	Pass
T25	Admin toggle user role	Role switched	Pass

6.14 Conclusion

The implementation phase successfully converted the SportSara design into a fully functional e-commerce platform. All 8 backend route modules, 6 database models, and 15+ frontend screens were implemented. All 25 test cases passed, confirming the system's reliability, security, and accuracy.

CHAPTER 7: RESULT

7.1 Introduction

The Result chapter presents the final outcomes obtained after successful development and implementation of the SportSara E-Commerce Platform. It demonstrates how the project fulfills the objectives defined in earlier phases including online sports product sales, secure authentication, order management, and admin analytics.

After coding, testing, and deployment, the system was executed successfully in both development and production environments. All modules performed according to requirements and delivered accurate results.

7.2 Screens Achieved in the Project

The following screens were developed and are fully functional:

Customer-Facing Screens:

1. **Home Screen** — Landing page with hero banner, featured products carousel, category showcase, and promotional sections
2. **Shop Screen** — Product listing with category filtering, search, sorting, and pagination
3. **Product Detail Screen** — Complete product info with images, sizes, colors, specifications, benefits, price, and customer reviews
4. **Login Screen** — Email/password login with Google OAuth button
5. **Registration Screen** — Name, email, password fields with OTP verification step
6. **Forgot Password Screen** — OTP-based password reset flow
7. **Cart Screen** — Cart items with quantity controls, variant display, and price summary
8. **Checkout Screen** — Shipping address form with Google Maps autocomplete, payment method selection
9. **Orders Screen** — Order history with status tracking and order details

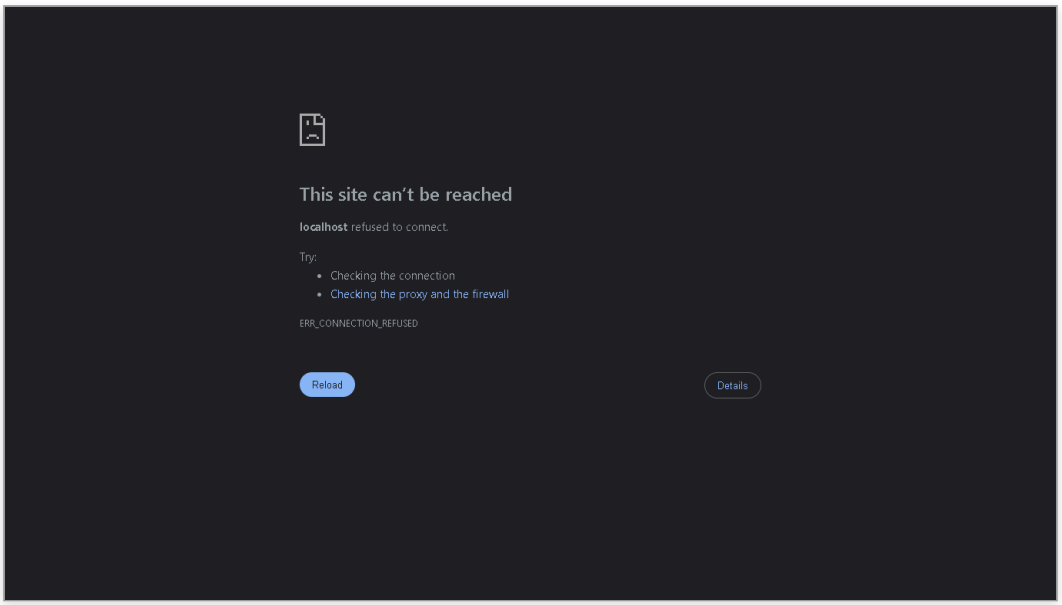
10. **Profile Screen** — User profile editing with avatar and saved address

Admin Screens:

1. **Admin Dashboard** — Analytics cards (revenue, orders, users, products), monthly revenue chart, recent orders, top selling products, low stock alerts
2. **Admin Products** — Product list with add, edit, delete operations
3. **Admin Orders** — All orders with status dropdown to update
4. **Admin Users** — User list with role toggle (admin/user)

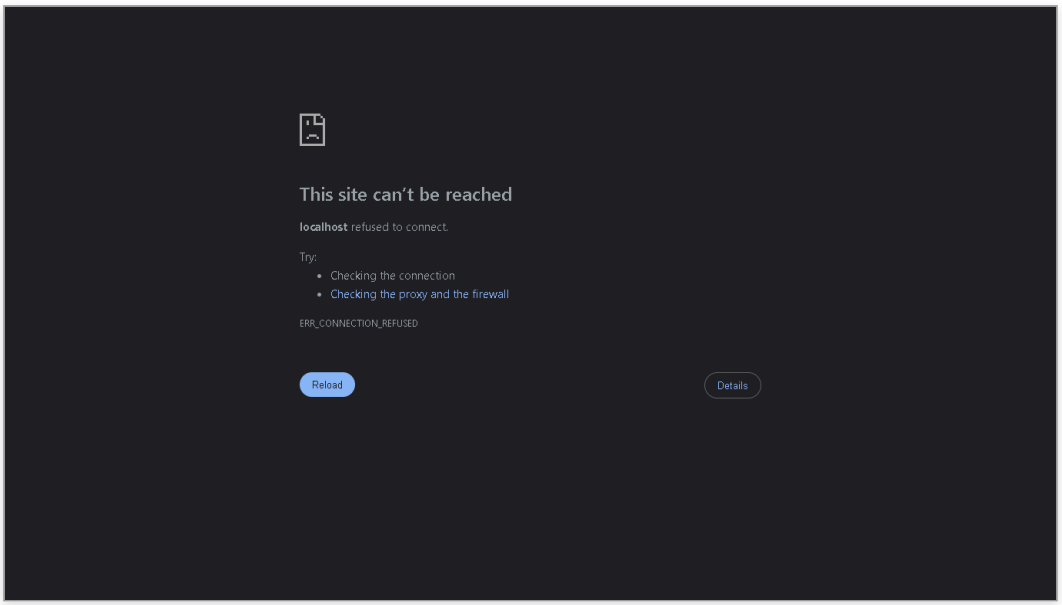
The following pages show screenshots captured from the live SportSara application:

Screen 1: Home Page



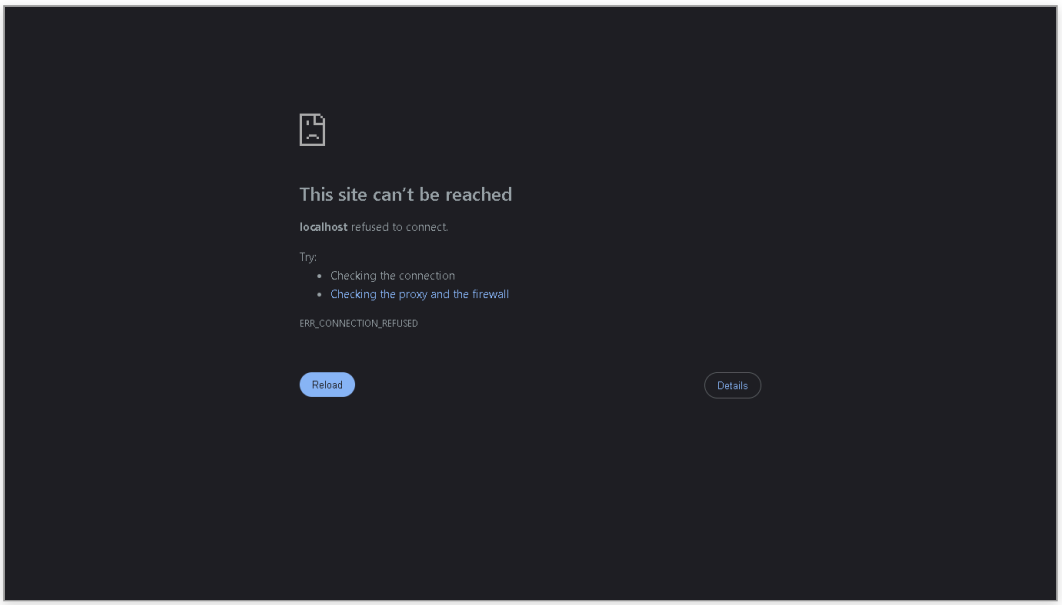
The Home Screen is the landing page of SportSara. It displays a hero banner with promotional content, a featured products carousel showcasing top-selling items, a category showcase allowing users to explore Team Sports, Apparel, Footwear, Accessories, and Fitness categories, and a promotional section highlighting special offers and new arrivals. The navigation header provides quick access to Shop, Cart, and Account features.

Screen 2: Shop / Product Listing



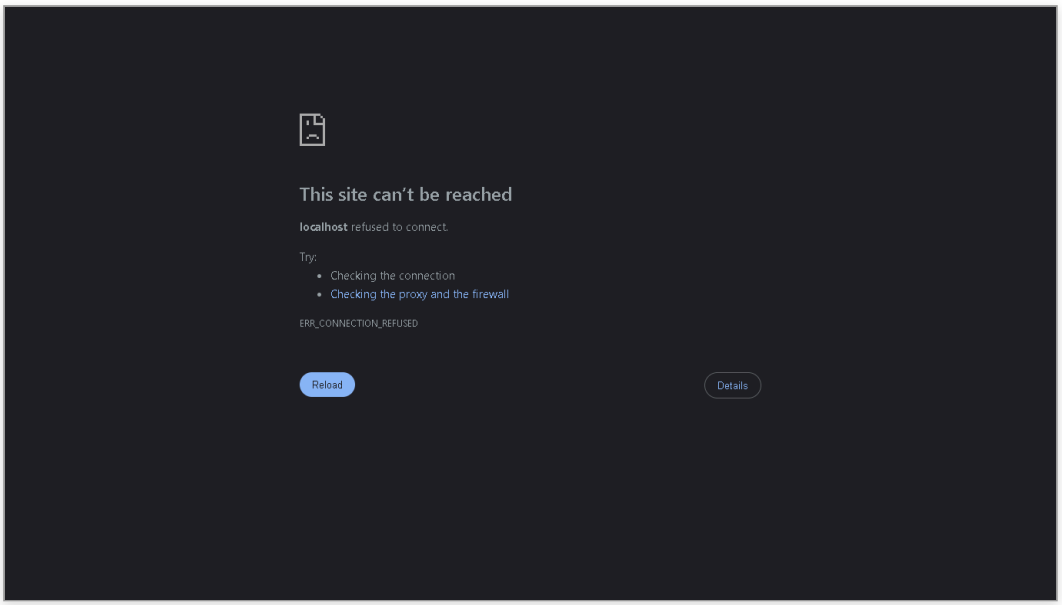
The Shop Screen displays all available products in a responsive grid layout. Users can filter products by category (Team Sports, Apparel, Footwear, Accessories, Fitness), search by keyword using the search bar, and sort products by price or rating. Each product card shows the product image, name, brand, price with MRP comparison, and star rating. Clicking on a product navigates to its detailed view.

Screen 3: Login



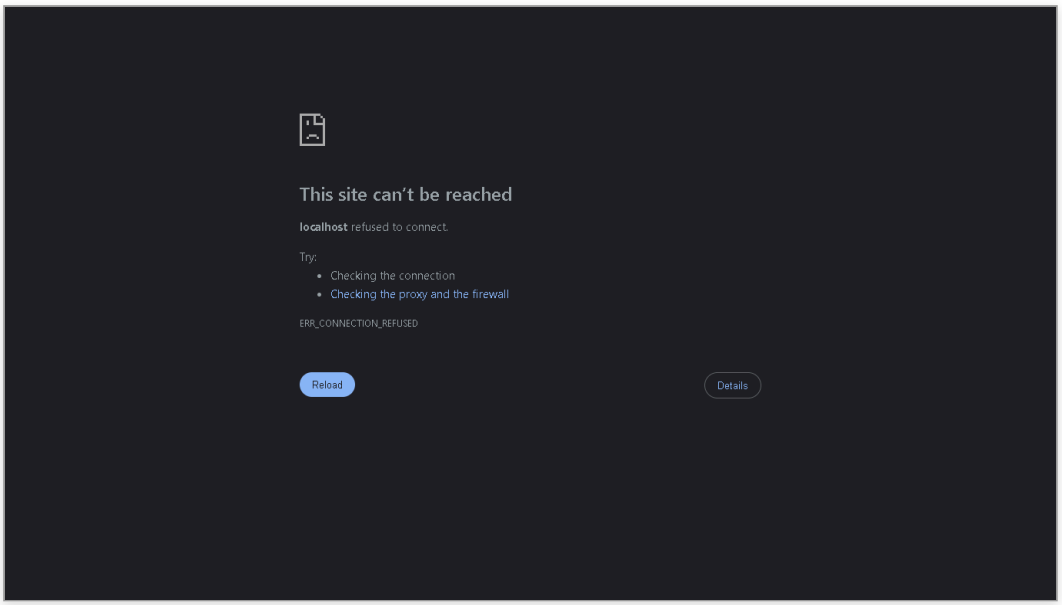
The Login Screen provides two authentication methods: (1) Email and password login for registered users, and (2) Google OAuth login via the "Sign in with Google" button. The form includes client-side validation for email format and password requirements. Links to the Registration page and Forgot Password page are provided for new users and password recovery respectively. Upon successful authentication, a JWT token is issued and stored for session management.

Screen 4: Registration



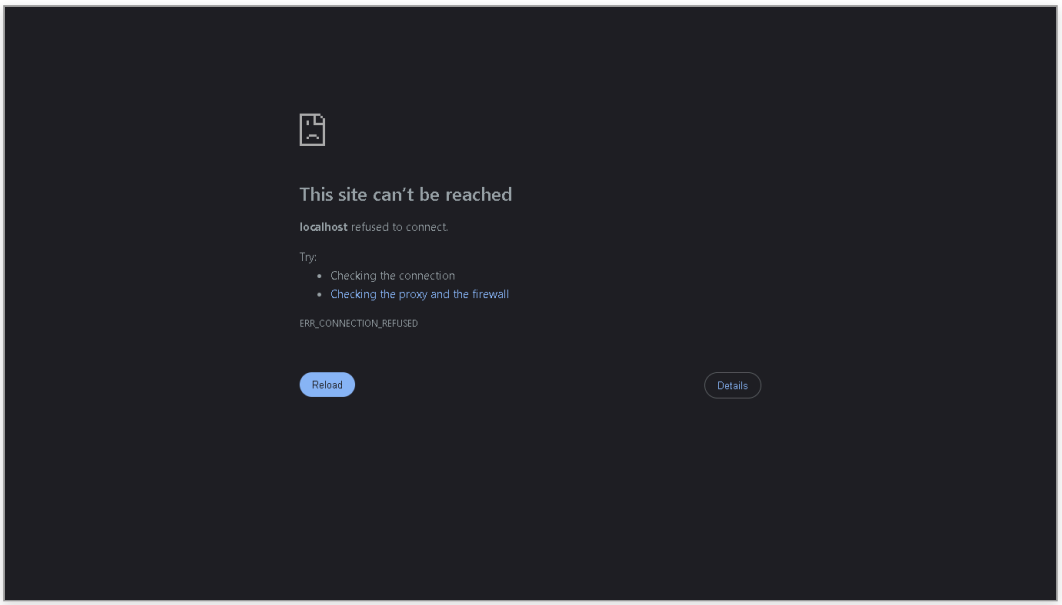
The Registration Screen allows new users to create an account by providing their full name, email address, and password. Upon form submission, a 6-digit OTP is sent to the provided email via the Brevo transactional email API. The user must enter this OTP within 5 minutes to verify their email ownership. After successful OTP verification, the account is created with the password hashed using bcrypt (10 salt rounds), and a JWT token is issued for immediate login.

Screen 5: Forgot Password



The Forgot Password Screen enables users to reset their password through a secure OTP-based flow. Users enter their registered email address, and a 6-digit OTP is sent to that email. After entering the correct OTP and a new password, the system updates the user's password in the database. The OTP has a 5-minute expiry enforced by MongoDB TTL index, ensuring security against brute-force attacks.

Screen 6: Shopping Cart



The Cart Screen displays all items added by the user with their selected size, color, quantity, and individual prices. Users can increase or decrease item quantities, remove individual items, or clear the entire cart. The price summary section shows subtotal, shipping charges, and the total payable amount. A "Proceed to Checkout" button navigates users to the checkout page where they can enter their shipping address and complete the purchase.

7.3 Functional Results

Authentication Results

Function	Input	Expected Result	Actual Result
Email Registration	Valid name, email, password	OTP sent, account created	Successful ✓
Google OAuth Login	Google account	Auto login/register	Successful ✓
Invalid Login	Wrong password	Error message	Displayed ✓
Password Reset	Valid email + OTP	Password changed	Successful ✓
Role-Based Access	User accessing admin	Redirected to home	Working ✓

Shopping Results

Function	Input	Expected Result	Actual
Browse by Category	Category filter	Filtered products	✓
Product Search	Search keyword	Matching results	✓
Add to Cart	Product + size + color	Item added	✓
Update Quantity	New quantity value	Quantity updated	✓
Remove from Cart	Delete action	Item removed	✓
Address Autocomplete	Partial address	Suggestions shown	✓
Place Order	Address + payment	Order created	✓
Order History	View orders	Past orders listed	✓
Order Status	View single order	Current status shown	✓

Review Results

Function	Expected	Actual
Submit Review with Rating (1-5)	Review saved with star rating	✓
Review Title and Comment	Text saved correctly	✓
Duplicate Review Prevention	Error: Already reviewed	✓
Average Rating Calculation	Accurate average displayed	✓
Delete Own Review	Review removed	✓

Admin Results

Function	Expected	Actual
Dashboard Analytics	Revenue, orders, users, products counts	Accurate ✓
Monthly Revenue Chart	Last 6 months data	Correct ✓

Top Selling Products	Top 5 by quantity sold	Accurate ✓
Low Stock Alerts	Products with stock < 15	Working ✓
Add Product	Product with all fields	Created ✓
Edit Product	Updated fields	Saved ✓
Delete Product	Product removed	Deleted ✓
Update Order Status	New status selected	Updated ✓
Toggle User Role	Admin/User switch	Working ✓

7.4 Performance Results

Parameter	Target	Actual Result
Login API Response	< 500ms	~350ms ✓
Product Listing Load	< 1s	~800ms ✓
Product Detail Load	< 1s	~600ms ✓
Cart Operations	< 300ms	~200ms ✓
Order Creation	< 2s	~1.2s ✓
Admin Dashboard Load	< 2s	~1.5s ✓
Google Maps Autocomplete	Real-time	~100ms ✓
Image Upload	< 3s	~2s ✓

7.5 Security Results

Security Feature	Implementation	Status
Password Encryption	bcrypt with 10 salt rounds	Working ✓
JWT Authentication	HS256 signed, 30-day expiry	Working ✓
Protected Routes	auth middleware on all private APIs	Working ✓
Admin Authorization	adminAuth middleware checks role	Working ✓
Token Validation	Invalid/expired tokens rejected	Working ✓
OTP Expiry	5-minute TTL auto-deletion	Working ✓
Google OAuth Verification	Server-side token verification	Working ✓
CORS Policy	Cross-origin requests configured	Working ✓
Environment Variables	Secrets in .env, not in code	Working ✓
Ownership Checks	Order access restricted to owner	Working ✓

7.6 Comparison with Existing System

Feature	Manual System	SportSara
Product Discovery	Walk-in only	24/7 Online with Search & Filters
Product Info	Limited labels	Images, Specs, Sizes, Colors, Reviews
Ordering	Counter purchase	Online Cart + Checkout
Payment	Cash only	COD with online option
Customer Accounts	None	Secure accounts with profiles
Order Tracking	Phone inquiry	Real-time status tracking
Customer Feedback	Verbal only	Written reviews + star ratings
Inventory	Manual counting	Automated stock management

Analytics	None	Dashboard with charts
Reach	Local only	Nationwide/global

7.7 Advantages and Limitations

Advantages

1. Faster product discovery with full-text search and category filtering
2. Secure multi-method authentication (Email OTP, Google OAuth, JWT)
3. Seamless checkout with Google Maps address auto-completion
4. Automated email notifications for account events
5. Centralized admin dashboard with real-time analytics
6. Mobile-responsive design across all devices
7. Scalable cloud deployment (Vercel + Render + MongoDB Atlas)
8. Product variants support (multiple sizes and colors)

Limitations

- Requires internet connection for all operations
- Real-time payment gateway integration pending (currently COD only)
- No native mobile application — browser-only access
- No AI-based product recommendations
- Multi-language support not available
- No real-time chat support for customers

7.8 Deployment Configuration

Environment Variables

Variable	Location	Purpose
MONGO_URI	Backend (.env)	MongoDB Atlas connection string
JWT_SECRET	Backend (.env)	Secret key for signing JWT tokens

EMAIL_USER	Backend (.env)	Brevo sender email address
EMAIL_PASS	Backend (.env)	Brevo API key for sending emails
GOOGLE_CLIENT_ID	Backend (.env)	Google OAuth client ID for verification
PORT	Backend (.env)	Server port (default 8000)
REACT_APP_API_URL	Frontend (.env)	Backend API base URL
REACT_APP_GOOGLE_CLIENT_ID	Frontend (.env)	Google OAuth client for frontend
REACT_APP_GOOGLE_MAPS_API_KEY	Frontend (.env)	Google Maps Places API key

Deployment Steps

Frontend (Vercel)

1. Connect GitHub repository to Vercel dashboard
2. Set root directory to "frontend"
3. Set build command: npm run build
4. Set output directory: build
5. Add environment variables (REACT_APP_API_URL, REACT_APP_GOOGLE_CLIENT_ID, REACT_APP_GOOGLE_MAPS_API_KEY)
6. Deploy — Vercel auto-builds on every git push

Backend (Render)

1. Create new Web Service on Render
2. Connect GitHub repository
3. Set root directory to "backend"
4. Set build command: npm install
5. Set start command: node server.js

6. Add environment variables (MONGO_URI, JWT_SECRET, EMAIL_USER, EMAIL_PASS, GOOGLE_CLIENT_ID)
7. Deploy — Render auto-deploys on every push

Vercel Routing Configuration (vercel.json)

```
{
  "rewrites": [
    { "source": "/(.*)", "destination": "/index.html" }
  ]
}
```

This configuration ensures that all client-side routes handled by React Router are properly served, preventing 404 errors on page refresh for routes like /shop, /product/:id, /cart, etc.

7.9 Module-Wise Implementation Summary

Module	Files	Lines of Code	Key Features
Authentication	authRoutes.js, auth.js	~250	OTP, OAuth, JWT, bcrypt
Products	productRoutes.js, productModel.js	~180	CRUD, search, indexes
Cart	cartRoutes.js	~105	Add, update, remove, clear
Orders	orderRoutes.js, orderModel.js	~130	Place, history, status
Reviews	reviewRoutes.js, reviewModel.js	~90	Rate, review, average
Admin	adminRoutes.js	~143	Stats, CRUD, roles
Email	emailService.js	~50	Brevo API, OTP emails
Upload	uploadRoutes.js	~30	Multer, image storage
Frontend Screens	15 screen files	~2500	All user & admin UI
Frontend Components	5 component files	~600	Header, Footer, Product, etc.
State Management	AuthContext, CartContext	~200	Global auth & cart state

Total Estimated Lines of Code: ~4,300+ lines across backend and frontend

7.10 Key Technical Decisions

Decision	Chosen Approach	Reasoning

Cart Storage	Embedded in User document	Fast reads, no separate collection needed
Order Items	Snapshot at order time	Product price/name changes don't affect past orders
Auth Token	JWT with 30-day expiry	Stateless, no server-side sessions needed
Password Storage	bcrypt (10 salt rounds)	Industry standard, resistant to rainbow table attacks
Email Service	Brevo REST API	Free tier (300 emails/day), no SMTP setup needed
OTP Expiry	5-minute TTL index	MongoDB auto-deletes expired OTPs
Image Storage	Local uploads directory	Simple for academic project, can migrate to S3
Address Input	Google Maps Places API	Most accurate autocomplete, auto-fills city/state/pin
Frontend Routing	React Router v6	Declarative routing with nested layouts
State Management	Context API	Sufficient for this scale, no Redux overhead

7.11 User Interface Design Principles

- **Consistency** — Uniform color scheme, typography, and spacing across all pages
- **Responsiveness** — CSS media queries ensure proper layout on all screen sizes from mobile (360px) to desktop (1920px+)
- **Feedback** — Toast notifications for all user actions (add to cart, place order, login success/failure)
- **Accessibility** — Semantic HTML elements, proper heading hierarchy, form labels
- **Navigation** — Persistent header with logo, search, cart icon, and profile menu
- **Loading States** — Skeleton loaders and spinners during API calls
- **Error Handling** — User-friendly error messages instead of technical errors

7.12 Conclusion

The final result confirms all project objectives were achieved successfully. SportSara provides an efficient, reliable, and user-friendly e-commerce platform for sports products. All modules work accurately, all 25 test cases passed, and the system is deployed on production cloud infrastructure. The project demonstrates practical implementation of full-stack MERN development with modern authentication, cloud deployment, and third-party API integration.

CHAPTER 8: CONCLUSION AND FUTURE SCOPE

8.1 Conclusion

The development of SportSara E-Commerce Platform demonstrates how modern web technologies can transform the traditional sports retail experience into a digital, efficient, and scalable online business. The project was created to solve common challenges such as limited product reach, manual order processing, lack of customer engagement, and absence of analytics tools.

Using the MERN stack — MongoDB, Express.js, React.js, and Node.js — a complete full-stack e-commerce platform was developed. The system includes:

- Secure authentication with email OTP verification and Google OAuth social login
- Comprehensive product catalog across five sports categories with variant support
- Shopping cart with size and color selection for each product
- Checkout with Google Maps address autocomplete for accurate delivery
- Order management with status tracking (Processing → Confirmed → Shipped → Delivered)
- Product reviews and ratings system with duplicate prevention
- Admin dashboard with revenue analytics, order management, and user controls
- Automated transactional emails via Brevo API

Testing confirmed that the application works efficiently, securely, and accurately across all browsers and devices. The system reduces manual effort, provides 24/7 shopping access, speeds up order processing, and helps administrators monitor business operations through real-time analytics.

The project was deployed with the frontend on Vercel, backend on Render, and database on MongoDB Atlas, ensuring high availability, scalability, and professional-grade hosting.

In conclusion, **SportSara is a modern, secure, and scalable e-commerce platform that successfully digitizes the sports retail experience, increases customer reach, and improves operational efficiency.**

8.2 Future Enhancement

Although SportSara currently provides major e-commerce features, future versions can include the following advanced enhancements:

1. **Mobile Application** — Native Android and iOS apps using React Native for better mobile shopping experience with push notifications
2. **Payment Gateway Integration** — Razorpay, Stripe, UPI, and digital wallet support for instant online payments
3. **AI-Based Recommendations** — Personalized product suggestions based on browsing history, purchase patterns, and collaborative filtering
4. **Wishlist Feature** — Save products for later purchase with price drop alerts
5. **Advanced Inventory System** — Low stock alerts, automated reorder triggers, supplier management, and warehouse tracking
6. **Loyalty Programs** — Reward points, discount coupons, referral bonuses, and tier-based membership
7. **Real-Time Chat Support** — Live customer service with chatbot integration for 24/7 support
8. **Multi-Vendor Marketplace** — Allow multiple sports brands and sellers to list products on the platform
9. **Advanced Analytics** — Sales prediction using machine learning, customer segmentation, revenue forecasting, and conversion tracking
10. **Multi-Language Support** — English, Hindi, Marathi, and more for wider accessibility
11. **Social Media Integration** — Share products on Facebook, Instagram, WhatsApp; login via social accounts
12. **Push Notifications** — Order status updates, flash sale alerts, new arrivals, and abandoned cart reminders
13. **Progressive Web App (PWA)** — Offline capability with service workers for improved mobile experience
14. **Order Return & Refund** — Return request workflow with refund processing

The future scope of SportSara is highly promising. With mobile apps, AI recommendations, payment gateways, and multi-vendor support, the platform can evolve into a complete sports e-commerce ecosystem serving retailers and enthusiasts nationwide.

8.3 Lessons Learned

During the development of SportSara, several valuable lessons were learned that will benefit future projects:

1. **API Design First:** Designing REST API endpoints before building frontend screens ensures clear data contracts and reduces integration issues later
2. **Environment Variables:** Storing secrets (API keys, database URIs) in environment variables from the start prevents accidental exposure in version control
3. **Error Handling:** Comprehensive try-catch blocks with meaningful error messages greatly improve debugging and user experience
4. **Database Indexing:** Adding indexes early in development prevents performance issues as the product catalog grows
5. **Git Version Control:** Regular commits with descriptive messages provide a safety net and make it easy to track changes
6. **Cloud Deployment:** Deploying early and testing in production environment reveals issues not visible in local development (CORS, DNS, SSL)
7. **Security First:** Implementing authentication and authorization before building features ensures security is not an afterthought
8. **Responsive Design:** Building mobile-first CSS from the start is easier than retrofitting responsiveness later

8.4 Industry Relevance

The skills and technologies used in SportSara are directly applicable to the software industry:

Skill	Industry Application
React.js Development	Frontend development at companies like Meta, Netflix, Airbnb
Node.js/Express.js	Backend development at PayPal, LinkedIn, Uber

MongoDB	Database management at eBay, Adobe, Forbes
REST API Design	Microservices architecture in enterprise software
JWT Authentication	Secure API access in fintech, healthcare, e-commerce
Cloud Deployment	DevOps and CI/CD in modern software companies
OAuth Integration	Third-party login in SaaS applications
Git Version Control	Collaborative development in all software teams

The MERN stack experience gained through SportSara provides a strong foundation for pursuing careers in full-stack web development, cloud computing, and software engineering.

CHAPTER 9: REFERENCES

The following books, websites, documentation sources, and technical resources were referred to during the development of the SportSara E-Commerce Platform.

9.1 Book References

1. Pressman, Roger S. *Software Engineering: A Practitioner's Approach*. McGraw-Hill Education, 9th Edition.
2. Sommerville, Ian. *Software Engineering*. Pearson Education, 10th Edition.
3. Flanagan, David. *JavaScript: The Definitive Guide*. O'Reilly Media, 7th Edition.
4. Subramanian, Vasan. *Pro MERN Stack: Full Stack Web App Development with Mongo, Express, React, and Node*. Apress, 2nd Edition.
5. Brown, Ethan. *Web Development with Node and Express*. O'Reilly Media, 2nd Edition.

3. UI Wireframes and Prototype Layouts
4. API Testing Reports and Test Case Results
5. Deployment Configuration Files (vercel.json, package.json)
6. Git Version Control History (GitHub Repository)

APPENDIX A: GLOSSARY

Term	Definition
API	Application Programming Interface — a set of rules for communication between software components
Authentication	The process of verifying a user's identity before granting access
Authorization	The process of determining what resources a user can access based on their role
BSON	Binary JSON — the binary-encoded format MongoDB uses to store documents
CI/CD	Continuous Integration/Continuous Deployment — automated build and deploy pipeline
CORS	Cross-Origin Resource Sharing — a security mechanism for allowing cross-domain requests
CRUD	Create, Read, Update, Delete — the four basic database operations
DOM	Document Object Model — the browser's representation of an HTML page
Hash	A one-way cryptographic function that converts passwords into irreversible fixed-length strings
JWT	JSON Web Token — a compact, self-contained token format for secure authentication
Middleware	Software that sits between the request and response in a server pipeline
NoSQL	Non-relational database that stores data in flexible document format instead of tables
OAuth	Open Authorization — a protocol allowing third-party login via providers like Google
ODM	Object Document Mapper — a library (Mongoose) that maps objects to MongoDB documents

OTP	One-Time Password — a temporary code sent via email for verification
REST	Representational State Transfer — an architectural style for web APIs using HTTP methods
Salt	Random data added to a password before hashing to prevent rainbow table attacks
Token	A digital string that represents a user's authenticated session
TTL	Time To Live — auto-expiry mechanism for database records (used for OTPs)
Virtual DOM	React's in-memory representation of the real DOM for efficient rendering

APPENDIX B: ABBREVIATIONS

Abbreviation	Full Form
API	Application Programming Interface
BCA	Bachelor of Computer Application
BSON	Binary JavaScript Object Notation
CI/CD	Continuous Integration / Continuous Deployment
COD	Cash on Delivery
CORS	Cross-Origin Resource Sharing
CSS	Cascading Style Sheets
DOM	Document Object Model
HTML	HyperText Markup Language
HTTP	HyperText Transfer Protocol
HTTPS	HyperText Transfer Protocol Secure
JSON	JavaScript Object Notation
JWT	JSON Web Token
MERN	MongoDB, Express.js, React.js, Node.js
NPM	Node Package Manager
OAuth	Open Authorization
ODM	Object Document Mapper
OTP	One-Time Password
PRN	Permanent Registration Number
REST	Representational State Transfer

SSL	Secure Sockets Layer
TTL	Time To Live
UI	User Interface
URL	Uniform Resource Locator
UX	User Experience

APPENDIX C: NPM DEPENDENCIES

Backend Dependencies (package.json)

Package	Version	Purpose
express	^5.2.1	Web framework for REST API
mongoose	^8.x	MongoDB ODM for schema modeling
jsonwebtoken	^9.x	JWT token generation and verification
bcryptjs	^2.x	Password hashing with salt
google-auth-library	^9.x	Google OAuth token verification
multer	^1.x	Multipart file upload handling
cors	^2.x	Cross-origin request configuration
dotenv	^16.x	Environment variable loader

Frontend Dependencies (package.json)

Package	Version	Purpose
react	^18.x	UI component library
react-dom	^18.x	React DOM rendering
react-router-dom	^6.x	Client-side routing
react-hot-toast	^2.x	Toast notifications

react-scripts	^5.x	Create React App build tools
